

## Plug-In Electric Vehicle Handbook for Consumers

PEVs are back and ready to compete with-and complement-the ubiquitous ICE technology. First, advances in electric-drive technologies enabled commercialization of hybrid electric vehicles (HEVs), which integrate an ICE or other type of propulsion source with batteries, regenerative braking, and an electric motor to boost fuel economy. Continued technological advances have spawned plug-in HEVs (PHEVs), which integrate small ICEs (or other types of propulsion sources) and large, grid-chargeable batteries that enable 10- to 40-mile all-electric driving ranges. Advanced technologies have also created a new breed of EVs that dont use an ICE at all. Only a few models of new-generation PEVs are available today, but, because of the benefits they offer, their market penetration and availability are growing quickly.
