

Macromolecular Reactions: Peculiarities, Theory and Experimental Approaches

Over the last three decades many fundamental problems relating to the chemical reactions of polymers have arisen. In this book three distinguished authors present for the first time a comprehensive, theoretical and experimental analysis of macromolecular reactions, summarising advances in the field. Designed as a guide for academics and for polymer chemists and physicists in industry, this will also be an invaluable textbook for post-graduates and students as it details the peculiarities of macromolecular reactions, the quantitative investigation of reaction kinetics, product structure and processes of chemical modification. The authors are all widely regarded as worldwide experts in this field.
