

Organotransition Metal Chemistry: From Bonding to Catalysis

Organotransition Metal Chemistry From Bonding to Catalysis provides a selective, but thorough and authoritative coverage of the fundamentals of organometallic chemistry, the elementary reactions of these complexes, and many catalytic processes occurring through organometallic intermediates. Built upon the foundation established by the classic text by Collman, Hegedus, Norton and Finke, this text consists of new or thoroughly updated and restructured chapters and provides an in-depth view into mechanism, reaction scope, and applications.
